

# 35. So itchy! Pin worms

Tamara the tigress has been having trouble sleeping for a few days. At night, her bottom itches a lot—so much that she can't sleep!

The strange thing is that it doesn't happen during the day.

So, Croco Doc decides to take a sample from the area for examination.

3

Using a microscope, Croco Doc can see what's in Tamara's bottom.

4

Well, well! Croco Doc observes tiny pinworm eggs.

It seems that Tamara has pinworms.

5

It's now clear where Tamara's itching comes from—it's a typical symptom of having intestinal worms.

Since she took Croco Docs  
syrup, her bottom no longer  
itches at night, and she sleeps  
without any problems!

A few days later, Tamara is feel-  
ing perfectly fine.

Pinworms are tiny worms that  
settle in the human intestine.

At night, female pinworms travel  
to the end of the intestine and  
lay eggs in the anal area. That's  
why Tamara has so much itching  
at night!

These little worms can enter our  
bodies through the mouth, so it's  
essential to be careful about what  
we put into our mouths.

Each female pinworm lays a lot  
of eggs.

Fortunately, there's a syrup that  
will make them all disappear.
